

Installation and Deployment Guide

Prerequisites

1. Ensure Node.js is installed on your system. You can download it from [Node.js Official Website](#).
2. Install `pm2` globally for process management:

```
npm install -g pm2
```

3. Install Angular CLI globally:

```
npm install -g @angular/cli
```

4. Ensure `bash` is available on your system to run the `deploy.sh` script.

Installation

1. Clone the repository:

```
git clone <repository-url>  
cd VAS_NEW/CAMPAIGN_MANAGER
```

2. Install dependencies:

```
npm install
```

Configuration

1. Update the `ecosystem.config.js` file if necessary to match your environment settings.
2. Ensure the `PORT` and `NODE_ENV` variables are correctly set for each environment (`development` , `staging` , `prod`).

Building the Angular Application

1. Build the Angular application for the desired environment:

```
npm run build:prod
```

Replace `prod` with the appropriate build script if needed.

Running the Application

1. Start the application using `pm2` :

```
pm2 start ecosystem.config.js --env development
```

Replace `development` with `staging` or `prod` as needed.

2. To check the status of the application:

```
pm2 status
```

3. To view logs:

```
pm2 logs
```

Deployment Using `deploy.sh`

1. Ensure the `deploy.sh` script is executable:

```
chmod +x deploy.sh
```

2. Run the script:

```
./deploy.sh
```

Additional Commands

- To stop the application:

```
pm2 stop ecosystem.config.js
```

- To delete the application from `pm2` :

```
pm2 delete ecosystem.config.js
```

Notes

- Ensure proper permissions are set for the deployment server.
- Monitor the application using `pm2` dashboard or logs for any issues.
